Experience with clustered applications, e-commerce gateways, custom recurring billing solutions, parallel processing, RH Linux, Apache, mod_perl, and Mysql.

Description:

UV Uptime has been developing a hosted third-party monitoring service for about a two years. It is written entirely in Perl and designed to allow for a fully automated web-based signup and setup procedure requiring no software installations on client servers.

Similar services would be: www.alertsite.com, www.atwatch.com, www.alertra.com

We are looking for a developer to finish the program from its current state and get it into production. The code is nearly complete. We have a specific TODO list to move it into production. There would be a lot of getting up to speed with the way the existing programs function with eachother for the first week or so.

We are looking for somebody who will not job-hop, desires long-term employment and, if working as a contractor, plans on offering ongoing support and maintenance.

We require a reliable, self-directed, productive developer.

The position also includes working on other sister-company projects as they come up. Many of our projects relate to custom system maintenance programs for clustered hosting setups and working with e-commerce gateways and billing systems.
